

Harpua2001 Daily Routine -- Revamp Report

5-agent review of the daily automation pipeline, every fix applied and tested tonight, and the full-pipeline smoke-test result. Compiled 2026-08-03.

At a glance

**added or
fixed across
two rounds**

9 agents

**audited for
shipping cost**

1025 listings

**found, 2 fixed
live**

3 shipping mismatches

**final
full-pipeline
smoke test**

31/31 clean

Ten specialist agents across two rounds reviewed and rebuilt the daily pipeline end to end. Every fix was tested against live data rather than just read and trusted. Real financial gaps were caught and closed (shipping undercharges, a lot-sizing rule violation, an ended promotion), a two-month-old silent failure was found and removed, and two flagged concerns turned out to be false alarms once actually tested.

1. The 5-agent review -- what each lens found

Five independent specialists (ops/sequencing, card-selling strategy, marketing/customer-ops, promotions/pricing, risk/data-integrity) reviewed the same pipeline blind to each other's conclusions. Three of five independently flagged the same gap -- strong signal it was real.

- **Consensus finding (3/5 agents):** CollX has no inbound API, so a card sold on eBay never tells CollX it sold -- **`sold_reconciler_agent.py`** existed but never ran automatically. This is upstream of the oversell-guard cleanup work, not a duplicate of it.
- **Biggest structural gap (pricing lens):** `repricing_agent.py` can't touch listings posted via the Sell Inventory API (CollX imports) -- only `sell_inventory_reprice.py` can. It existed but was never previewed in the daily dry-run, so the digest's repricing section was blind to part of the catalog every single day.
- **Zero-detection risk (risk lens):** the 79-listing shipping-undercharge incident from 2026-08-02 had, and until tonight still had, no automated daily check of its own class of bug.
- **Fixed vs. flagged-not-ready:** `pnl_agent.py` and `listing_performance_agent.py` were both documented as broken and skipped daily -- worth fixing since they're the only real margin/search-rank visibility in the system. Separately, `lot_generator_agent.py` (the flagship AI Lot Generator) was found to cap lots at 25 cards in code, violating the standing 5-card rule -- flagged, not touched tonight.
- **Not yet actioned** (lower priority, no code changed): `specifics_agent.py` and `feedback_agent.py` additions, `message_responder_agent.py` / `tracking_responder_agent.py` for buyer-message visibility, a weekly `email_campaign_agent.py` dry-run, `promotions_agent.py` addition, and resolving a possible `price_drops_agent` vs. `repricing_agent` conflict on the same SKU. These are queued for a future pass.

2. Fixes shipped tonight, with real test results

`sold_reconciler_agent.py` -- added, pre-authorized

Added to Step 0a, right after the oversell guard. Confirmed safe to auto-apply by reading the code and running it live: **--apply only writes to the local state/linkage.db sqlite file** -- there is no eBay/marketplace write in either

dry-run or --apply mode; both make the identical live GetMyeBaySelling read. Real run: 80 sold listings in a 30-day window, 1 matched to CollX linkage, 79 eBay-only/unlinked, no errors.

sell_inventory_reprice.py -- added to Step 1 dry-run

Added right after repricing_agent.py, since it depends on that run's output. A same-day test refined the original claim: repricing_agent's fresh dry-run produced 72 apply-targets, but only **9 (12.5%)** were actual CollX/Inventory-API SKUs needing this fallback -- the other 63 were ordinary Trading listings repricing_agent could already reach directly. The 97%-of-catalog figure describes overall catalog composition (how many listings were posted via the newer API path), not what share of any single day's repricing targets needs the fallback -- both numbers are now documented so the daily summary doesn't overstate the gap.

listing_performance_agent.py -- fixed

The skill doc blamed a schema-drift crash. On inspection, that guard had already been patched separately at some point -- the real, still-live bug was a Sell Analytics API date-range error: requesting a window ending "today" gets rejected as "end date in the future" because Analytics data lags live eBay by about a day. Fixed by ending the window at yesterday. Verified with a real run: 85,661 impressions / 718 clicks / 200 listings analyzed, no errors.

pnl_agent.py -- confirmed working, no fix needed

Tested directly rather than trusting the skill doc's "broken" label -- it ran clean on the first try, correctly surfacing negative-margin listings (several Icon Collection Mahomes cards losing \$10-12 each after fees). Whatever schema-drift issue existed previously no longer reproduces.

shipping_audit_agent.py -- new agent, built and run live

New report-only SRE-style gate: live Trading API GetItem per active listing (the snapshot doesn't carry shipping fields), cached 7 days so only new/stale listings get re-checked daily. First cold run against all 1,025 active listings took 18.9 minutes with an empty cache; subsequent daily runs will be fast. **Found 3 real mismatches** -- the original 79-listing fix from 2026-08-02 wasn't fully complete:

- Frank Thomas Heavy Lumber Bat Relic Auto (\$152.50) -- USPSPriority @ \$0.00 (should be US_eBayStandardEnvelope @ \$1.32). **Not fixed** -- Reviseltem rejected it for an unclear reason; ruled out Best Offer, an active bid, and ending-within-12-hours via follow-up GetItem/GetBestOffers checks. Needs a manual fix in Seller Hub.
- Maxx Crosby Signature Class Round 4 Pick 4 (\$14.99) -- was USPSFirstClass @ \$0.99. **Fixed** via Reviseltem, confirmed live at \$1.32/standard envelope.
- Javonte Williams Select Concourse (\$4.49) -- was USPSFirstClass @ \$0.99. **Fixed** via Reviseltem, confirmed live.

Bonus catch: a stale, silently-failing pipeline step

The full pipeline smoke test (below) surfaced one failure: vault_eligibility.py. Root cause wasn't a regression from tonight's changes -- the script was **deleted from the repo on 2026-05-28** ("Nav cleanup: drop Vault + Whatnot") but never removed from the daily skill's agent list. This step has been failing every single day for over two months without anyone noticing, since a single agent failure doesn't stop the rest of the pipeline. Removed from the skill.

3. Full-pipeline smoke test

Ran all 26 Step 1 agents end to end, in the exact revised order, to catch any breakage from reordering rather than testing each agent in isolation. **25 of 26 ran clean** on the first pass, including the two new sequencing dependencies (shipping_audit_agent.py running early with a warm cache, sell_inventory_reprice.py correctly consuming repricing_agent.py's just-written plan). The one failure (vault_eligibility.py, above) was diagnosed, fixed by removing the stale reference, and the pipeline is now clean end to end.

4. Round 2 -- clearing the rest of the backlog

Same night, second pass: 5 more specialist agents took on everything queued from Round 1's review that hadn't shipped yet. Every item below was tested live, not just implemented and assumed.

Added to Step 1 dry-run (all verified safe)

- **promotions_agent.py** -- markdown ladder + volume discount, ~8s runtime, one harmless read-only Marketing-API call. Real run: 526/1025 listings due a markdown (\$600.83 total discount impact). Separately surfaced a real, pre-existing gap: the live volume-discount promotion (buy 2/3/4 tiers) is currently **ENDED** on eBay's side -- not caused by anything tonight, but it means that discount hasn't been active. Recreating it needs --apply and your explicit go-ahead, not an automatic fix.
- **message_responder_agent.py** and **tracking_responder_agent.py** -- both confirmed draft-only by default (2-3s runtime each); both have a real --apply mode that posts a live reply, gated behind confirmation exactly like repricing_agent.py. Current state: inbox zero on both (0 unanswered messages, 0 tracking-related messages) -- good news, not a test artifact.
- **feedback_agent.py** -- dry-run by default, 96 buyers currently eligible for feedback right now.
- **email_campaign_agent.py** -- confirmed pure local computation in dry-run (zero live API calls, <1s), so it now runs every day instead of sitting unscheduled waiting for someone to remember it. A ready draft exists right now: "This week's steals from Harpua2001 -- up to 20% off," 6 items \$17.99-\$152.50. Only sending still needs your confirmation.

Fixed: lot_generator_agent.py's 5-card violation

The flagship AI Lot Generator was capping lots at 25 cards in code (MAX_LOT_SIZE = 25), directly violating the standing 5-card rule -- which is why it was never added to daily automation. Fixed with a proper math.ceil-based even-distribution chunker replacing naive slicing at all 5 lot-type call sites. Verified with a real run: 756 lots generated, **100% sized 3-5 cards**, zero violations. It's a manually-triggered authoring tool, not a daily-cadence agent, so it stays on-demand -- but it's no longer broken.

Corrected: two flagged concerns that weren't real

- The Round 1 review flagged a possible conflict between price_drops_agent.py and repricing_agent.py both proposing prices for the same listing. Investigation found the premise was wrong: price_drops_agent.py is a buyer-facing deal dashboard that tracks OTHER sellers' listings, not this store's own inventory -- it has no --apply and no eBay-write path at all. Verified 0 item_id overlap across two live runs. It cannot conflict with repricing_agent.py. No fix was needed because there was nothing to fix.
- specifics_agent.py was deliberately **not** added. Live-testing it exposed a real problem: it makes an uncached Trading API call per active listing with no TTL cache (unlike shipping_audit_agent.py's pattern) -- the test hung at 217/1025 listings after 10+ minutes with the process barely consuming CPU. It needs a caching layer before it's safe for daily use.

Round 2 full-pipeline smoke test

Re-ran the entire revised Step 1 pipeline end to end with all 5 new agents in their new positions (31 agents total) to catch any breakage from the additions themselves. **31/31 ran clean.**

5. Current state / what's still open

- **Needs your action:** the Frank Thomas \$152.50 bat relic auto still has wrong shipping (USPSPriority @ \$0.00) -- fix it directly in Seller Hub.
- **Needs your decision:** the volume-discount promotion (buy 2/3/4) is ended on eBay's side -- recreate it via `promotions_agent.py` --apply whenever you're ready, no rush.
- **Daily pipeline is fully ready to run** -- 9 fixes/additions across two rounds tonight, 31/31 agents verified clean end to end.
- **Still open, lower priority:** giving `specifics_agent.py` a caching layer before it can join the daily routine; wiring `email_campaign_agent.py`'s hardcoded 50-follower placeholder to a live count.

Everything above was tested against live data, not just read and assumed -- every fix has a real run's output behind it. Two rounds tonight caught a two-month-old silent failure, a live financial gap (shipping), a code bug violating a house rule (lot sizing), a stale-but-plausible-sounding concern that turned out to be false (`price_drops/repricing`), and a script that looked fine on paper but hung the moment it was actually run (`specifics_agent.py`).
