

Claude + Fivetran — 1-Hour Demo Cheat Sheet

blue = boss types · grey = you drive

You describe intent in plain English; Claude writes the API/infra work and verifies it. Boss is hands-on at the keyboard.

Before he arrives — your 15-min pre-flight

1. export FIVETRAN_API_KEY=key:secret and confirm a test call to /v1/groups returns 200.
2. Run the Terraform in infra/ (S3 + Glue bronze/silver/gold + IAM role). Confirm terraform output shows **bucket_name** and **fivetran_role_arn**.
3. Verify the Fivetran **external_id** + AWS account id in tfvars are current — if stale, the destination create fails on permissions. Fix it now, not on stage.
4. Pre-create the OAuth source (e.g. a Google Sheet with sample data) and confirm you can sign into that provider from this machine.
5. Open the Fivetran dashboard in a browser tab so the connector appears live as he creates it.
6. Do one full dry run yourself end-to-end, then delete the throwaway group so the live run is clean.

The hour

0:00	Frame it: intent in English, Claude does the API + infra. Show your setup.	You
0:10	Prompt 1 — create the AWS MDLS destination	Boss
0:16	Prompt 2 — create OAuth connector; open Connect Card, sign in via OAuth	Boss
0:24	Prompt 3 — trigger the initial sync	Boss
0:27	While it syncs: Hybrid deployment talking point + range prompts	You
0:42	Prompt 4 — verify tables + rows landed in the lake	Boss
0:52	Cleanup prompt + Q&A;	Both

While it syncs — show the range (you)

- "Research [account] via the FivetranKnowledge MCP — open tickets, last Gong call."
- "Draft a QBR deck outline for that account."
- "This same flow scaffolds a whole ODI demo — Terraform, connector, dbt, frontend."

The prompts he types

Paste one at a time; let Claude finish each before the next. Plain English on purpose — he never touches a command.

Prompt 1 — AWS MDLS destination

Create a new Fivetran Managed Data Lake destination on AWS. Make a new group called boss-demo. Run terraform output in ./infra for the S3 bucket, IAM role ARN, and Glue bronze database, and use those in us-east-1. Read the key from \$FIVETRAN_API_KEY, call the REST API, and show me the destination id and its setup status.

Prompt 2 — OAuth source connector

Create a Google Sheets connector in the boss-demo group via the REST API, then generate a Fivetran Connect Card authorization link and give me the URL so I can sign in with OAuth.

Then in the browser: open the Connect Card URL Claude returns, sign in with OAuth, pick the data to sync, and click Save. No passwords typed. Swap "Google Sheets" for Salesforce, HubSpot, or GA4 — any OAuth source.

Prompt 3 — trigger the sync

Trigger the initial sync on that connector, then poll its status every 30 seconds until the first sync finishes. Tell me when it's done and which tables landed.

Prompt 4 — verify in the lake

Query the Glue bronze database through Athena and show me the tables Fivetran created, plus a sample of rows from the largest one, so we confirm the data actually arrived.

Cleanup — after the demo

Delete the boss-demo group and its connector and destination from Fivetran so we leave the account clean. Confirm they're gone.
