

Harpua2001 eBay Site — Ops Reference

DAILY ROUTINE (5 MIN)

```
cd ~/Documents/GitHub/jason_chletsos_ebay_lots

# Full rebuild + push to GitHub Pages
python3 promote.py

# Apply repricing decisions
python3 promote.py --reprice-apply

# Fill Item Specifics gaps (Cassini rank)
python3 specifics_agent.py --apply --no-fetch

# Auto-respond to best offers
python3 best_offer_autorespond_agent.py --apply

# Auto-respond to buyer messages
python3 message_responder_agent.py --apply
```

Or just say "run the daily tasks" — the `harpua-daily` skill handles the full dry-run sweep and waits for your `--apply` confirmation.

AGENT QUICK-REFERENCE

Goal	Command	Notes
Reprice to market	<code>python3 repricing_agent.py</code>	dry-run; add <code>--apply</code>
Send watcher offers	<code>python3 watchers_offer_agent.py --apply</code>	needs <code>sell.negotiation</code> scope
Best offer bulk push	<code>python3 best_offer_agent.py --apply</code>	slow — per-item API
Promoted listings bids	<code>python3 promoted_listings_agent.py --apply</code>	
Photo quality report	<code>python3 photo_audit_agent.py</code>	P1 open issue
Lot generator	<code>python3 lot_generator_agent.py</code>	flagship feature
CollX import	<code>python3 collx_ingest.py</code>	staging only, never auto-post
Emergency reprice	<code>python3 emergency_reprice.py</code>	break-glass

SKILL INVOCATIONS

Skill	When to use
<code>/harpua-daily</code>	Every morning. Dry-run sweep of all agents, waits for your <code>--apply</code> confirmation.
<code>/ebay-search</code>	Research competitor listings before repricing or building a new lot.
<code>/frontend-design</code>	Visual overhaul of any site page — avoids generic AI aesthetics.
<code>/code-review</code>	Run after any non-trivial agent change before deploying Lambda.
<code>/verify</code>	Confirm a code change works in the live site before reporting done.
<code>/deep-research</code>	Multi-source market research (e.g. which refractors are appreciating) before a lot build or price inference pass.
<code>/creating-data-visualizations</code>	Quick charts from pricing or audit output without building a full page.

USEFUL PROMPTS

- "Run the daily tasks" — triggers `harpua-daily`
- "Fan out 4 agents to research [card/set]" — bulk comp research
- "Make [page] look great" — triggers `frontend-design` polish
- "Add a new agent that does X" — follows dry-run/apply pattern
- "Audit the [agent] plan output and tell me what to apply" — reads `output/*.json` and summarizes recommended actions

ONE-TIME OUTSTANDING (MANUAL_STEPS.MD)

#	Task	Est.
1	Upload <code>docs/ebay_billboard.jpg</code> to eBay Store Design	3 min
2	Re-mint OAuth token with <code>sell.negotiation</code> scope via <code>python3 oauth_remint_helper.py</code>	5 min

Lambda deploy	<code>cd ebay_notifications && ./deploy.sh</code>	after AWS SSO login	3	Sign up for eBay Partner Network → set <code>epn_campid</code> in <code>configuration.json</code>	5 min
			4	Submit <code>docs/google_feed.xml</code> to Google Merchant Center (free Shopping placement)	5 min
			5	Add <code>ANTHROPIC_API_KEY</code> to Lambda env vars (activates AI Assistant page)	2 min

| SKILLS WORTH ADDING

- A price-tracking / market data MCP skill — would speed up the pricing loop beyond the current SportsCardsPro scrape
- A Google Merchant Center skill — monitoring the Shopping feed is currently manual
- A push notification skill — get the daily digest on your phone without opening Claude Code
